configuration.

Claims

A locking member for locking a card with respect to a shelf having an end with a [1] groove upon completing a card loading process into the shelf, the locking member comprising: a connecting section joined to the card; a resilient section extending from the connecting section and having a resilience; and an engagement section formed at an end of the resilient section and having a shape configured to engage into the groove. The boking member of daim 1, further comprising: [2] an extension section extending from the engagement section, wherein a position of the engagement section is lowered due to a shrinkage of the resilient section when the extension section is pressed. [3] The locking member of daim 2, wherein the connecting section, the resilient section, the engagement section and the extension section are integrally formed with one another. [4] The locking member of claim 1, wherein the resilient section has a U-shaped
